

# ROWALLAN

POLL DORSET STUD

PERFORMANCE  
BRED RAMS

0429 060 378 - 0458 147 997

## 2024 Annual on Farm Sale

Friday 6th September

139 Selected Poll Dorset Stud Rams

Inspections welcome from 11:00am

Sale commencing at 1:30pm

“Hillview” 3054 Olympic Way Crowther

Lunch available

# Definitions of abbreviations

<b>DOB:</b>	Date of Birth
<b>BT:</b>	Birth Type – Single (1); Twin (2); Triplet (3); Quad (4)
<b>BWT:</b>	Birth Weight
<b>WWT:</b>	Weaning Weight
<b>PWT:</b>	Post Weaning Weight
<b>PFAT:</b>	Post Weaning Fat Depth
<b>PEMD:</b>	Post Weaning Eye Muscle Depth
<b>IMF:</b>	Intramuscular Fat – Rams with more positive IMF produce lambs that have a higher fat % in the loin muscle, marbling.
<b>SF5:</b>	Shear Force – Rams with a more negative SF5 produce lambs that require less force to cut loin muscle.
<b>LMY:</b>	Lean Meat Yield – Rams with a positive LMY produce lambs that will have a higher lean meat yield percentage at slaughter.
<b>DRESS:</b>	Dress Percentage – Rams with a more positive DRESS produce lambs that have a higher dressing percentage at slaughter.
<b>EQ:</b>	Eating Quality Index
<b>TCP:</b>	Terminal Carcase Production Index
<b>Acc:</b>	Accuracy of the ASBV (Australian Sheep Breeding Value) reflects the amount of information used to estimate the animals breeding value. An animal with a higher accuracy is more likely to produce progeny as suggested by its ASBV.

# Understanding LAMBPLAN Terminal ASBVs

- Australian Sheep Breeding Values (ASBVs) allow you to compare the genetic differences between rams.
- Rams contribute half of a lamb's genetics. Rams have the largest impact on genetic progress, as they have more progeny throughout their lifetime.
- ASBVs are based around 0. It is important to compare ASBVs against current industry percentiles, which can be found on the Sheep Genetics website.
- ASBVs are reported with an accuracy figure. The higher the accuracy, the more information there is contributing to the ASBV, and the closer it is to the true breeding value of the animal.
- ASBVs are reported with an age stage, shown as a letter at the beginning of a trait e.g. weaning weight is WWT.
- Indexes combine traits into a single ranking value to describe an animal's suitability for a given production system.

## How to interpret ASBVs

A selection index is an important tool to drive genetic improvement when there are a range of traits of economic or functional importance. Rams with higher indexes will produce lambs that are more suited to a particular production system.

Intramuscular fat (IMF) is a measure of the chemical fat percentage in the loin muscle of a lamb and is often referred to as marbling. IMF has been shown to have a significant impact on the flavour, juiciness, tenderness and overall liking of lamb. Rams with more positive IMF ASBVs produce progeny with more intramuscular fat.

Rams with a more positive ASBV for weight (WT) will produce lambs that grow faster and therefore reach target weights in a shorter period of time.

Rams with a positive ASBV for fat (FAT) will produce lambs that are fatter, at the same weight. This ram will produce lambs that are on average 0.5mm fatter at the GR site when compared with an ASBV of 0mm.

Shear force (SF5) is a measure of the force or energy required to cut through the loin muscle of lamb after 5 days of ageing, the ASBV is reported in deviations of kilograms of force. Rams with more negative SF5 ASBVs produce lambs with more tender meat.

INDEX	WT (kg)	EMD (mm)	FAT (mm)	LMY (%)	IMF (%)	SF5 (kg)	LE_DIR (%)	WEC (%)
199.46	9.5	1	1	2.4	-0.1	-0.5	3.0	-40
ACC. 58	ACC. 70	ACC. 65	ACC. 63	ACC. 57	ACC. 55	ACC. 57	ACC. 55	ACC. 52

Rams with a more positive ASBV for eye muscle depth (EMD) produce lambs that have more muscle. A ram with an ASBV of 1mm will breed lambs with 0.5mm more eye muscle than a ram with an ASBV of 0mm.

Rams with a more positive ASBV for lambing ease (LE\_DIR) will produce lambs that have a lower incidence of lambing difficulties. A ram with an LE\_DIR of 3% will produce 1.5% fewer difficult lambing events than a ram with an ASBV of 0%.

Rams with more positive lean meat yield (LMY) ASBVs produce lambs that have a higher lean meat yield percentage at slaughter. Lean meat yield is expressed as a percentage of the Hot Standard Carcase Weight, where all bone and salvage fat is removed. A ram with an ASBV of 2.4 will produce progeny that are 1.2 percent higher than progeny of a ram with an ASBV of 0.

Rams with a more negative worm egg count (WEC) ASBV will produce progeny that are more resistant to worm burdens. A ram with a WEC ASBV of -40% will produce progeny that have 10% less worms compared to a ram with an ASBV of -20%.

# LAMBPLAN terminal indexes

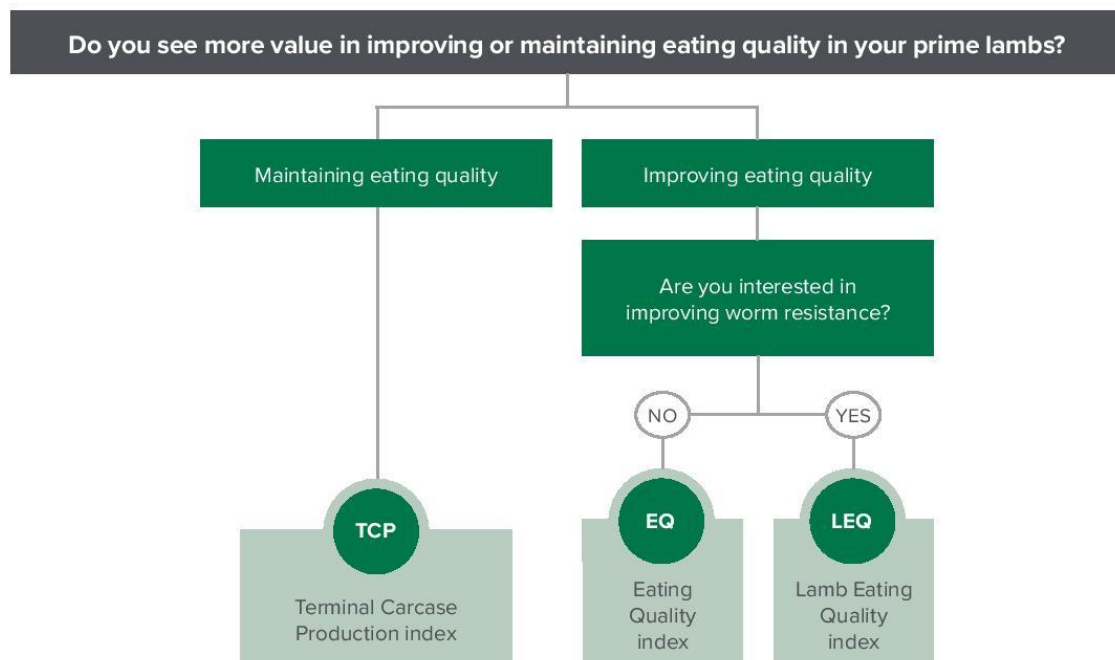

## A ram buyer's guide

Indexes help you select animals for use within a breeding program when there are many traits of importance.

Using indexes in your ram purchasing decisions allows you to make balanced genetic progress towards more profitable sheep. A ram with a higher index will produce progeny that are more profitable in that production system.

### Choosing the right index

The following flowchart helps producers determine the best index for their terminal production system:

### How to use the chosen index to assist in purchasing decisions:

#### Before the sale:

1. Rank animals in the sale on the value of your chosen index.
2. Consider the individual ASBVs which are important to you to create a short list of rams to look at on sale day.

#### At the sale:

3. Look through your short list of rams to find the ones that meet your structural and type requirements.

To assist in benchmarking sale rams relative to the current year drop of animals in the Sheep Genetics database, use the percentile band tables, which are found on the Sheep Genetics website: [sqsearch.sheepgenetics.org.au/Search/Percentiles.aspx?AnalysisId=2](https://sqsearch.sheepgenetics.org.au/Search/Percentiles.aspx?AnalysisId=2). The animals in the top 10th percentile rank the highest on the index, and those in the 90th percentile rank the lowest.

A brief overview of each of the indexes is included below. If you would like further information on how these selection indexes are generated, please refer to the *Terminal Indexes – ram breeder guide* at [sheepgenetics.org.au/Getting-started/ASBVs-and-Indexes](https://sheepgenetics.org.au/Getting-started/ASBVs-and-Indexes).

### Terminal Carcase Production (TCP)

The TCP index is for a prime lamb production system where terminal sires are joined to ewes of a Merino/maternal breed or cross. The TCP index focuses on increasing weight and muscle while reducing carcass fat. These are changes which contribute to higher lean meat yield. TCP also has emphasis on modest improvements in eating quality.

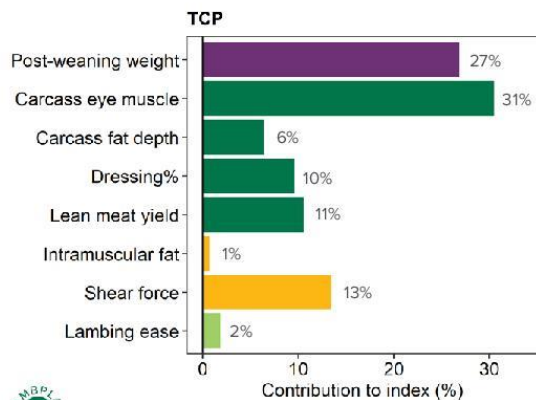

Typical trait changes for the TCP index include:

- increasing post weaning weight
- increasing carcass eye muscle depth
- decreasing carcass fat depth
- increasing dressing percentage
- increasing lean meat yield
- slightly improving eating quality
- improving lambing ease.

Sheep with better eating quality will have higher ASBVs for intramuscular fat (more marbling) and lower ASBVs for shear force (better tenderness).

Figure 1 illustrates which traits are in the index and how much they contribute to the overall balance of the index. The longer the bar, the greater the impact on the index, and the greater impact on the profitability of the production system.

**Figure 1: The traits in the TCP index and how they contribute to the overall balance of the index**

© Sheep Genetics 2022

## Eating Quality (EQ)

The EQ index is for a prime lamb operation where terminal sires are joined to ewes of a Merino/maternal breed or cross, and where producers are interested in improving the eating quality of their lambs to a greater degree than is possible with the TCP index. Because of the added emphasis on eating quality, there is less emphasis on growth and carcass traits, although they will still improve.

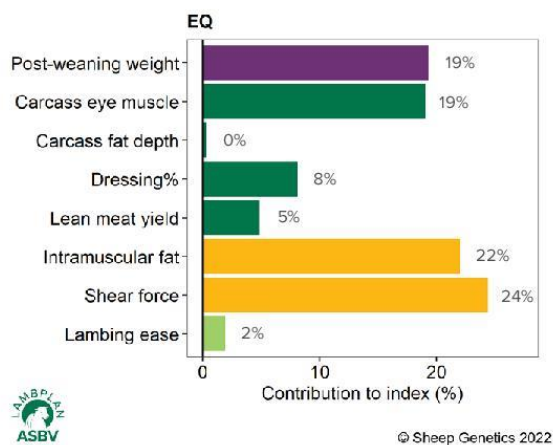

Typical trait changes for the EQ index include:

- increasing post weaning weight
- increasing eye muscle depth
- maintaining/small reduction in carcass fat
- increasing dressing percentage
- increasing lean meat yield
- large improvement in eating quality
- improving lambing ease.

Sheep with better eating quality will have higher ASBVs for intramuscular fat (more marbling) and lower ASBVs for shear force (better tenderness).

Figure 2 illustrates which traits are in the index and how much they contribute to the overall balance of the index. The longer the bar, the greater the impact on the index, and the greater impact on the profitability of the production system.

**Figure 2: The traits in the EQ index and how they contribute to the overall balance of the index**

## Lamb Eating Quality (LEQ)

The LEQ index is for a prime lamb operation where terminal sires are joined to ewes of a Merino/maternal breed or cross in high rainfall and/or high input management systems where internal parasites may cause significant economic losses.

Producers who select this index are interested in improving the eating quality of their lambs to a greater degree than is possible with the TCP index. Growth and carcass traits will still improve, and inclusion of worm egg count will aid in control of internal parasites.

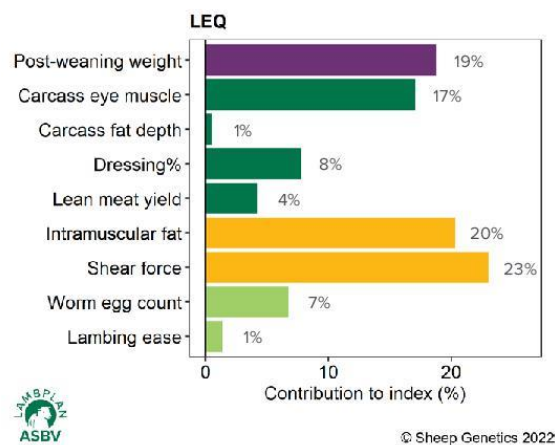

Typical trait changes for the LEQ index include:

- increasing post weaning weight
- increasing eye muscle depth
- maintaining/small reduction in carcass fat
- increasing dressing percentage
- increasing lean meat yield
- large improvement in eating quality
- improving lambing ease
- increasing resistance to worms.

Sheep with better eating quality will have higher ASBVs for intramuscular fat (more marbling) and lower ASBVs for shear force (better tenderness).

Figure 3 illustrates which traits are in the index and how much they contribute to the overall balance of the index. The longer the bar, the greater the impact on the index, and the greater impact on the profitability of the production system.

**Figure 3: The traits in the LEQ index and how they contribute to the overall balance of the index**
